DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 1 to 5, 11, 12, 19, 20, 21 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over, Anderson U.S. Patent No. 6,567,122 and further in view of Favreau, U.S. Patent No. 6,531,707.
 - Claim 1 recites "an image apparatus having an image element connected to a processing element and memory". Anderson discloses in lines 5-8 and lines 40-45 of column 6 an imaging apparatus (digital camera) that consists of an image element connected to the computer (118, figure 1) built internally that consists of a processing element (344, figure 3) and a memory (346).

Claim 1 recites "a software process for compressing and reformatting the image data and information from the machine vision tool into the web-browser compatible form for transmission over a communication interface, interconnected to the processing element, to a human/machine interface device having a display, the web-browser-compatible image data and information being adapted for display on the human/machine interface device". Anderson discloses in lines 27-37 of

Art Unit: 2625

column 8, lines 14-18 of column 10 and lines 41-56 column 12, also teaches of a web server (figure 9) and software process responsible for compressing and reformatting the image data and information into a web-browser-compatible form for transmission over a communications interface, interconnected to the processing element, to a human/machine interface device having a display, the web-browser-compatible image data and information being adapted for display on the human/machine interface device

Claim 1 recites "wherein the human/machine interface is adapted to display web-browser-compatible image data and the information on a plurality of user-selected screens". Anderson teaches in lines 34-38 of column 9 that a human/machine interface device can be a personal computer, wireless PCS phone or a network computer and apparently these devices are capable of displaying image data and information in web-browser-compatible image format.

Claim 1 recites "the processing element is adapted to perform a machine vision tool task while the human/machine interface device is disconnected from the communications interface". Anderson discloses in lines 46-55 of column 5 discloses that the image data and information can be transferred to human machine interface device at any time which makes it apparent that processing element can perform operations independently of the connection to the human/machine interface.

Art Unit: 2625

Claim 1 recites "a machine vision tool for performing a machine vision process on the image data". Anderson discloses multiple software processes (figure 9) that can be run on the processing element to control the functions and parameters of the camera in lines 52-55 of column 6, lines 1-4 of column 7 and lines 36-42 of column 15. Anderson discloses an image apparatus that is basically the same as recited in claim 1 except that Anderson does not teach this image apparatus being used in machine vision systems.

Favreau discloses a machine vision system in figure 1 and lines 25-55 of column 9, which includes a camera (16) connected to a computer where as all the image processing and other controls are handled by the hardware and machine vision software tools residing inside the computer and computer is connected to an input device such as keyboard or mouse and a display monitor (18) to display the results. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the invention of Anderson in view of Favreau. One would have been motivated to use the system of Anderson in a machine vision system as in Favreau because both systems are devoted to imaging and because Favreau shows a specific application to which Anderson can be applied and it would be a matter of replacing camera and computer of Favreau with that of Anderson.

Art Unit: 2625

- Claim 2 recites "the human/machine interface as set forth in claim 1 wherein the screen include buttons for selecting predetermined functions for at least one of installing, configuring, training, monitoring and controlling the machine vision system". Anderson teaches in lines 45-64 of column 10 and lines 60-65 of column 13 that the web page screen of the human/machine interface device can include control buttons for controlling.
- The limitations of claim 3 are met by Anderson as applied to claim 1 above.
 - The limitations of claim 4 are met by Anderson and Favreau as applied to claim 1 above. Claim 4 also recites "the human/machine interface device comprises a personal digital assistant (PDA)" instead of a computer as in claim 1. Anderson discloses in lines 34-38 of column 9 that a human/machine interface device can be a personal computer, wireless PCS phone or a network computer and in fact these devices are capable of displaying image data and information in web-browser-compatible image format. Therefore, it would have been obvious to one having ordinary skill in the art at the time of the invention to modify the invention of Anderson. One would have been motivated to use a PDA in place of a computer, where PDA is a small hand-held computer capable of receiving wired and wireless signals and displaying image data and information in web-browser compatible form as human/machine interface device.

Application/Control Number: 10/036,310 Page 6

Art Unit: 2625

Claim 5 recites "the human/machine interface as set forth in claim 4 wherein the communication interface includes support for data transmission to a PDA over one of a wireless link and a cable link".
 Anderson in lines 64-65 of column 11 teaches the communication to the human/machine can be done through USB, IEEE1394 and infrared link where USB and IEEE1394 are cable links and infrared link is a wireless link.

- The limitations of claim 11 are met by Anderson and Favreau as applied to claim 4 above.
- Claim 12 recites a method steps that correspond to the apparatus defined by claim 1, and is thus met by the combination of Anderson and Favreau as applied to claim 1 above.
- The limitations of claim 19 are met by Anderson and Favreau as applied to claim 12 above.
- Claim 20 recites a method steps that correspond to the apparatus defined by claim 4, and is thus met by the combination of Anderson and Favreau as applied to claim 1 above.
- The limitations of claim 21 in combination with claim 20 are met by Anderson and Favreau as applied to claim 5 above.
- The limitations of claim 28 are met by Anderson and Favreau as applied to claim 20 above.

Art Unit: 2625

- 3. Claims 6 and 23 are rejected under 103(a) as being unpatentable over Anderson U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No. 6,531,707 and further in view of Cadjan, January 2000, publication "Upgrading Novell Client software across the network using acu.exe".
 - Claim 6 recites "human/machine device, includes a generic machine vision application residing thereon and the processing element is adapted to install a specialized machine vision application over the communication interface to the human/machine interface device". Anderson in lines 52-55 of column 6 and lines 1-5 of column 7 discloses software programs to control the operations of the camera that are stored in the memory. Anderson also discloses in lines 36-43 of column 15 that parameters of these software applications running inside the camera can be changed according to the user needs. It is in fact clear from the above arguments that if a user wants to change parameters of application program running inside the apparatus according to his/her control needs, the user has to write some kind of script or some kind of program on another external computing device such as another computer, which then can be then transferred to the apparatus's memory through communication interface. The image apparatus will only understand this script if the image apparatus and external computing device share the same platform of the application in which the script was constructed or vice-versa. Therefore, it is obvious that the same generic machine vision software application in

which the script runs should be resided on both image apparatus and external computing device. Anderson and Favreau do not teach the limitation "the processing element is adapted to install a specialized machine vision application over the communication interface to the human/machine interface device".

Cadjan in her technical paper discloses a server/client model of Novell Network where the client gets upgraded automatically when client logins to the network. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the invention of Anderson in view of Favreau and in further view of Cadjan. One would have been motivated to host a file server in the image apparatus where the machine vision application resides and if a machine vision application was upgraded on the image apparatus, the server would install this special new/upgraded machine vision application on the client (PDA) automatically whenever client talks to the image apparatus.

- The limitations of claim 23 in combination with claim 20 are met by Anderson and Favreau and in further view of Cadjan as applied to claim 6 above.
- 4. Claims 7 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over, Anderson U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No.

6,531,707 and further in view of Takagi, U.S. Patent No. 6,670,991 and Bose, U.S. Patent No. 4,975,972.

claim 7, recites "a machine vision process that determines an intensity distribution of the image data and that transmits information with respect to the determined intensity distribution, and wherein the human/machine interface device includes a process for displaying, based upon the information, a visual representation of the intensity distribution so as to assist in adjusting at least one of the lighting intensity, shutter exposure time, lens aperture, and parameters affecting the intensity distribution in the image data". Anderson and Favreau do not teach the machine vision process that determines intensity distribution of the image data and transmits the information with respect to the determined intensity distribution.

Bose discloses a machine vision process in lines 22-30 of column 4 that determines an intensity distribution of the image data and the information with respect to intensity distribution can be displayed on a monitor (34). Bose des not teach of transmitting this information to another computer.

Takagi discloses of an image apparatus connected to an client computer in figure 7 and in lines 6-12 and 25-40 of column 5, lines 30-45 of column 6 and lines 10-14 of column 11 where are all camera parameters can be displayed in visual representation on the client display and client with respect to displayed parameters has the capability to

change the parameters. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the invention of Anderson in view of Favreau and in further view of Bose and Takagi. One would have been motivated to use the image apparatus by Anderson in view of Favreau in machine vision systems where one would have used the machine vision process used by Bose to determine the intensity distribution of the image data and one would have used the method described by Takagi to display the parameters on the client display where client can be any human/machine interface device such a computer or a PDA and client as described by Takagi can be used to change the parameters according to the user needs.

- The limitations of claim 25 in combination with claim 20 are met by Anderson and Favreau and in further view of Bose as applied to claim 7 above.
- 5. Claims 8, 9, 26 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over, Anderson U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No. 6,531,707 and further in view of Takagi, U.S. Patent No. 6,670,991 and Bose, U.S. Patent No. 5,040,228.
 - Claims 8 recites "a machine vision process that determines a relative degree of focus of the image data and that transmits encoded information with respect to the determined relative degree of focus, and wherein the

Art Unit: 2625

human/machine interface device includes a process for displaying, based upon the encoded information, a current focus value so as to assist in adjusting focus". Anderson and Favreau does not teach the machine vision process that determines a relative degree of focus of the image data and transmits the encoded information with respect to the determined relative degree of focus.

Bose discloses a machine vision process in lines 1-20 of column 2 that determines the sharpness of focus of the image data and the information with respect to determined sharpness of focus could be displayed on a monitor. Bose does not teach of transmitting this information to another computer.

Takagi in figure 7 and in lines 6-12 and 25-40 of column 5, lines 30-45 of column 6 and lines 10-14 of column 11 discloses of an image apparatus connected to an client computer where are all camera parameters can be displayed as a function of time, distance and frequency etc., in visual representation on the client display and client with respect to displayed parameters has the capability to change the parameters. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify the invention of Anderson in view of Favreau and in further view of Bose and Takagi. One would have been motivated to use the image apparatus by Anderson in view of Favreau in machine vision systems where one would have used the machine vision process used by

Art Unit: 2625

Bose to determine the relative degree of focus of the image data and one would have used the method described by Takagi to display the parameters on the client display where a client can be a human/machine interface device such as a computer or a PDA and client as described by Takagi can change the parameters according to the user needs.

- The limitations of claim 9 are met by Anderson and Favreau in further view of Bose and Takagi as applied to claim 8 above.
- The limitations of claims 26 and 27 in combination with claim 20 are met by Anderson and Favreau and in further view of Bose as applied to claim 8 above.
- 6. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Anderson, U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No. 6,531,707 and further in view of Yu, U.S. Patent No. 6,804,418.
 - Claim 10 recites "human/machine interface device includes a display that
 is insufficient in resolution and refresh rate to provide a real time display
 for adjusting either of focus or aperture of lens of the image element".
 From the previous explained claims a PDA is used as human/machine
 interface device. Anderson and Favreau do not teach about the resolution
 and refresh rate of the PDA.

Yu discloses in lines 10-15 of column 1, in lines 1-10 of column 2 and lines 45-50 of column 2 PDA display panels do not have sufficient resolution to display high-resolution images and discloses the technique for generating

Art Unit: 2625

low-resolution images from the high-resolution images for the PDAs. A lower resolution and a lower refresh rate are the inherent properties of the PDA due to the compact size, low power operation and lower processing speed.

- 7. Claims 13, 14, 15, 16, 17, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over, Anderson U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No. 6,531,707 and further in view of Nichani, U.S. Patent No. 5,673,334.
 - Claims 13, 14 and 15 recites "the method of transfering configuration information from the human/machine interface device to the memory over the communications interface, wherein the step of transferring configuration information includes providing training information to the memory and wherein the step of displaying includes monitoring a live image acquired by the image element based upon the image data and information". Anderson and Favreau do not teach anything about configuring or providing the training to the memory of image device.

Nichani discloses a machine vision system in lines 40-50 of column 5, which is trained by an operator by transferring a training model program to the memory of the machine vision system to configure the system for future operations. Nichani also discloses in lines 9-21 of column 6 that displaying includes monitoring a live image acquired by the image element based upon the image data and information. It would have been obvious to one having an ordinary skill in the art at the time of invention was made

to modify the combined invention of Anderson and Favreau in further view of Nichani. One would have been motivated to store a configuration or training program in the memory to configure the system for control operations.

- Claim 16 recites "a method which comprises (a) establishing a link between the human/machine interface device and the communications interface, (b) at least one of installing, configuring, training or monitoring the machine vision systems by exchanging information over the link and (c) removing the link". The limitations "(a) establishing a link between the human/machine interface device and the communications interface, and (c) removing the link" recited in claim 16 are rejected on the basis of rejection of claim 12. Anderson in combination with Favreau does provide a machine vision systems the interface to connect to a human/machine interface device through a communication interface. Anderson combined with Favreau does not teach of the limitation "(b) at least one of installing, configuring, training or monitoring the machine vision systems by exchanging information over the link". Nichani as explained in rejection for claim 14, 15 and 16 provides a method for configuring the machine vision system by exchanging information over the link.
- Claim 17 recites "the method as set forth in claim 16 wherein the step of establishing the link comprises web pages on the human/machine interface based upon a web server in the machine vision system that

Art Unit: 2625

interacts with the communication interface to convert the image data and information into web-based data packets". The limitations of claim 17 are met by Anderson and Favreau as applied to claim 12 above.

- The limitations of claim 22 in combination with claim 20 are met by Anderson and Favreau and in further view of Nichani as applied to claim 16 above.
- 8. Claims 18 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over, Anderson U.S. Patent No. 6,567,122 in view of Favreau, U.S. Patent No. 6,531,707 and further in view of Fallon, U.S. Patent 4,985,846.
 - Claim 18 recites "the method as set forth in claim 12 further comprising communicating control information to a remote device through the communication interface so as to direct a device function in accordance with a predetermined instruction of the machine vision tool". Anderson combined with Favreau specifically does not teach of using such a method in machine vision systems.

Fallon in lines 42-50 of column 4 discloses machine vision system method of controlling a robot. It would have been obvious to one having an ordinary skill in the art at the time of invention was made to modify the invention of Anderson combined with Favreau in view of Fallon. One would have been motivated to add to the power of processing device to control a remote device through the communication interface so as to

Application/Control Number: 10/036,310 Page 16

Art Unit: 2625

direct a device function in accordance with a predefined instruction of the machine vision tool.

 The limitations of claim 24 in combination with claim 20 are met by Anderson and Favreau and in further view of Fallon as applied to claim 18 above.

Conclusion

- 9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - Csipkes, U.S. Patent No. 5,768,401 discloses a balanced focus system and method to achieve optimal focus of different areas of an object.
 - Tan, U.S. Patent No. 6,381,357 discloses a method foe hi-speed deterministic approach in detecting defective pixels within an image sensor.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Manav Seth whose telephone number is (703)306-4117. The examiner can normally be reached on Monday to Friday from 8:00 am to 5:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Joseph Mancuso, can be reached on (703) 305-3885. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
